**Instructions:** Answer all questions to the best of your ability. Show all your work in the space provided for full credit.

---

1. The solutions of the equation  $x^2 + 2x + 2 = 0$  are  $x = p$  and  $x = q$ . Find a quadratic equation with solutions  $y = \frac{1}{p}$  and  $y = \frac{1}{q}$ . (10)

*Hint: First find the values of  $p$  and  $q$ , then use the relationship between roots and coefficients.*

2. Find the vertex and axis of symmetry of the parabola that is the graph of the equation  $y = x^2 + 2x + 5$ . (8)

3. Graph the equation  $x = 2y^2 - 4y + 1$ . What is its vertex? (8)

4. Find all solutions to each of the following equations: (12)

(a)  $r^2 - 7r = 0$

(b)  $x^2 + 3x = 7x - x^2$

(c)  $2x^2 = 242$

(d)  $16 - y^2 = -4$

5. Suppose  $x^2 + 7bx + 10b^2 = 0$ . (10)

(a) Solve for  $x$  in terms of  $b$ .

(b) Find all  $b$  such that  $x = 25$  is a solution of the equation.

6. Consider the quadratic  $3y^2 - y - 12$ . (12)

- (a) Notice that this quadratic cannot be factored into the product of two binomials with integer coefficients. Does this mean that the quadratic does not have any real roots?

- (b) If the answer to part (a) is "no," then explain how we know that the quadratic does have real roots.

*Hint: Use the discriminant.*

- (c) Suppose the quadratic has roots  $y = r$  and  $y = s$ . Find a quadratic with roots  $r + 2$  and  $s + 2$ .

*Hint: Use the quadratic formula to find the exact values of  $r$  and  $s$ .*

7. Graph the equation  $3(x + y)^2 = 6xy + 27$ . (8)

*Hint: Expand and simplify the equation first.*

8. Suppose the quadratic  $x^2 + bx + c$  equals 0 when  $x = r$  or  $x = s$ . If  $r^2s + rs^2 = 10$ , and  $b$  and  $c$  are integers, find all possible ordered pairs  $(b, c)$ . (10)

*Hint: Factor  $r^2s + rs^2$ .*

9. Show that the two values

(12)

$$x = \frac{2c}{-b \pm \sqrt{b^2 - 4ac}}$$

are the roots of the equation  $ax^2 + bx + c = 0$ , where  $a$ ,  $b$ , and  $c$  are constants, and  $a$  and  $c$  are nonzero.

*Hint: That expression looks like the quadratic formula turned upside down.*

*Hint: Let  $x = \frac{1}{y}$  in  $ax^2 + bx + c = 0$ . What is  $y$ ?*
